"IT WASN'T RAINING WHEN NOAH BUILT THE ARK"

By David Bull

It's a common misconception that floating gardens are a new invention. In fact, they have been used for centuries in various parts of the world. The concept is simple: plants are grown in a floating platform made of water hyacinths or other aquatic plants. This allows them to grow in shallow water and provides a natural filtration system for the water. The floating platform can be made from a variety of materials, including bamboo, plastic, or metal. The plants are secured to the platform with ropes or ties. This system is used for growing vegetables, fruits, and ornamental plants. It is also used for water purification and as a natural habitat for fish and other aquatic life.
